

Vehicle Switch Panel System

InPower's standard VCMS switch panel systems provide an affordable solution for controlling your vehicle auxiliary loads.

Standard VCMS switch panel systems are offered in four-switch and six-switch configurations. The individual switches are programmed to operate as a momentary or latching function. Standard programs are offered with different combinations of momentary and latching switches. The switches activate their respective power outputs on the remote power module. Included with each system is a set of 200 switch legends. This legend library contains the most commonly used switch descriptions and are easily installed in the switch module. Refer to InPower Owner's Manuals OM-125 (Four Switch) or OM-126 (Six Switch) for details on functionality, specifications and installation.
